✓

S/057/62/032/012/012/017

B104/B186

On the excitation of electromagnetic...

are considered. In a coordinate system, where the electrons and the ions satisfy the condition $\sum_s \beta_s^2 \omega_{0s}^2 = 0$, the equation (6) is split into three equations for the range $\omega^2 \gg \Omega_s^2$. One of them is

$$\frac{\omega^2}{c^2} - k^2 \left(1 + \sum_i \frac{\omega_{0i}^2 \beta_i^2}{\omega^2} \right) - \sum_i \frac{\omega_{0i}^2}{\gamma_i^2 c^2} = 0 \quad (7).$$

The solution of (7) is

$$\omega = \pm \sqrt{\frac{k^2 c^2 + \sum_i \frac{\omega_{0i}^2}{\gamma_i^2}}{2}} \pm \frac{1}{2} \sqrt{\left(k^2 c^2 + \sum_i \frac{\omega_{0i}^2}{\gamma_i^2} \right)^2 - 4k^2 c^2 \sum_i \omega_{0i}^2 \beta_i^2}. \quad (8)$$

From this it appears that if $|\vec{k}|$ is arbitrary and if $\vec{k} \beta_s = 0$, ω always possesses a $\text{Im}\omega > 0$ in this range. In the range $\omega^2 \ll \Omega_s^2$ (6) takes the form

Card 4/6

S/057/62/032/012/012/017
B104/B186

On the excitation of electromagnetic...

holds in the frequency range in which the spatial dispersion can be neglected. Substituting (2) and (4) into (1) gives

$$\left[k^2 \left(1 + \sum_s \frac{\omega_{ns}^2 \beta_s^2}{\omega^2 - \Omega_s^2} \right) - \frac{\omega^2}{c^2} a_s \right] \left[a_1 \left(k^2 - \frac{\omega^2}{c^2} a_1 \right) - \frac{\omega^2}{c^2} g_1^2 \right] - \frac{\omega^2}{c^4} k^2 a_1 g_1^2 + \frac{k^2}{c^2} a_s^2 \left(k^2 - \frac{\omega^2}{c^2} a_1 \right) + 2 \frac{k^2 \omega^2}{c^4} g_1 g_s a_s = 0. \quad (6),$$

if (3) and

$$\left. \begin{aligned} 1 - \sum_s \frac{\omega_{ns}^2}{\omega^2 - \Omega_s^2} &= a_1, & 1 - \sum_s \frac{\omega_{ns}^2}{\omega^2 - \Omega_s^2} &= a_2, & \sum_s u_s \frac{\omega_{ns}^2}{\omega^2 - \Omega_s^2} &= -a_n, \\ \sum_s u_s \frac{\omega_{ns}^2 \Omega_s}{\omega (\omega^2 - \Omega_s^2)} &= -g_B, & \sum_s \frac{\omega_{ns}^2 \Omega_s}{\omega (\omega^2 - \Omega_s^2)} &= -g_n. \end{aligned} \right\} \quad (5)$$

Card 3/6

X

On the excitation of electromagnetic...

S/057/62/032/012/012/017

a photoelectric integrator and an optical multiplier based on double modulation of light implemented by electrochemical modulators. To extend their dynamic range, each modulator optical filter contains an independent focusing system. This focusing system consists of a hemispherical lens and a conical light conductor which concentrates the light flux on the working region of the filter. To assure compactness and simplicity of construction optical filters and focusing components form a double-layer matrix board in which the electrochemical modulator electrodes are interconnected in rows and columns. layer. The dispersion equation is derived and its roots are discussed in several limiting cases that permit simplification. When the Langmuir frequencies of the plasma and the beam differ greatly, perturbations with frequencies lower than the lower of the two Langmuir frequencies are unstable. When the beam Langmuir frequency is the lower, this instability is aperiodic and its increment is smaller by a factor $\sqrt{2}$ than that of the aperiodic instability of the corresponding unbounded system. When the axial component of the propagation vector is small, the increment of azimuthally symmetric surface waves is exponentially small, and such waves propagating only in the azimuthal direction do not exist. For transverse waves with transverse wavelength small compared with the radius of the plasma cylinder, the present dispersion equation gives results similar to those previously derived by the author (Radiofizika, VI, 941, 1963) from the usual boundary conditions. This is to be expected because the boundary conditions have little effect on short wavelength oscillations. The author thanks E.A.Perel'steyn for valuable discussions and O.I. Yarkovoy (deceased) for calling his attention to the applicability of one of the equations employed in the work. Orig. art. has: 29 formulas.

TITLE: On surface waves in a current carrying plasma of finite radius

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 10, 1966, 1752-1757

TOPIC TAGS: plasma stability, plasma beam interaction, surface wave, relativistic electron, plasma electromagnetic wave

ABSTRACT: The author discusses the stability with respect to axially symmetric surface waves of a uniform quasineutral plasma cylinder of finite radius carrying a uniform beam of the same radius of relativistic electrons. The dielectric tensor is derived from Maxwell's equations and the hydrodynamic equations, linearized for an axially symmetric perturbation propagating both axially and azimuthally. Boundary conditions for the electromagnetic fields at the boundary of the plasma are derived by integrating the curl of the magnetic field across the transition layer at the boundary, the thickness of which is assumed to be small compared with the wavelength of the perturbation. The boundary condition thus obtained for the azimuthal component of the magnetic field differs from the usual one in that it contains a term proportional to the radial component of the electric field. These boundary conditions are valid when the Debye radius is much smaller than the thickness of the transition

TITLE: Interaction of a neutral relativistic beam of charged particles with a magneto-active plasma

SOURCE: Zhurnal tehnicheskoy fiziki, v.33, no.8, 1963, 897-900

TOPIC TAGS: plasma, electromagnetic wave, Cerenkov excitation

ABSTRACT: The author discusses electromagnetic waves in a neutral beam of charged particles moving at relativistic velocity parallel to an external magnetic field through a plasma at rest. The dispersion equation (and some of the notation) is taken without further explanation from work of A.A.Rukhadze (ZhTU,32,No.6, 1962). Thermal motion and collisions are neglected. The solutions of the dispersion equation are discussed for waves propagating in the direction of the external magnetic field and for longitudinal waves propagating in other directions. Conditions are found for Cerenkov excitation of the waves. It is pointed out that the Langmuir frequency is invariant under Lorentz transformation, and recent work of T.Neufeld and H.Wright (Phys.Rev.,124, 1, 1961) is criticized for improper transformation of

SOURCE: Ref. zh. Fizika, Abs. 10E42

REF SOURCE: Uch, zap. Mosk. obl. ped. in-ta, v. 147, 1964, 23-26

TOPIC TAGS: fluid viscosity, fluid property, fluid friction, ultrasonic absorption, temperature dependence , benzene, methyl alcohol

TRANSLATION: An experimental study was made of the shear and second viscosities of a binary mixture at various temperatures. The shear viscosity coefficient was measured directly, while the second viscosity coefficient was calculated from the ultrasonic absorption coefficient in a liquid in terms of the shear viscosity coefficient. A characteristic of the second viscosity was observed in the critical temperature region. It is hypothesized that this is due to the decay of associated complexes close to the critical point.

REF SOURCE: Sb. Primeneniye ul'traakust. k issled. veshchestva. Vyp. 20. M., 1964,
153-157

TOPIC TAGS: fluid viscosity, fluid property, fluid friction, ultrasonic absorption

TRANSLATION: Ultrasonic attenuation in binary mixtures of benzene and methyl alcohol with 16.7 and 60% (by weight) benzene and the saturation line was studied experimentally at various temperatures, including the neighborhood of the critical point. The shear viscosity of the mixtures was measured. The apparatus and measurement techniques are described in detail. The data were used to find the temperature dependence of the second viscosity coefficient. N. Kuznetsov.

backing plate and clamped in a special fixture with a pressure of 256 kg per each clamp, i.e., per 4—5 kg/cm² of weld. The edges of the clamps are located 13 mm from the joint, which reduces the hot cracking because at the temperature of hot cracking the weld is under compression. The design strength of welds was tested on high-pressure vessel #4 (211 mm inside diameter and 600 mm long). The welds were stress relieved at 650C and found satisfactory. Orig. art. has: 1 figure. TITLE: Carbon dioxide-shielded arc welding of steel

SOURCE: Byulleten' tekhniko-ekonomiceskoy informatsii, no. 7, 1966,
5-6

TOPIC TAGS: carbon dioxide,arc welding, shielded arc welding, super-strength steel welding, super strength steel / 28Kh3SNMVFA steel

ABSTRACT: A method of carbon dioxide-shielded arc welding of 28Kh3SNMVFA super-strength steel sheets 2.8 mm thick has been developed and introduced in industry. The method employs a welder equipped with a resistor which makes it possible to adjust the current with an accuracy of ± 2.5 amp. To ensure a satisfactory ductility and adequate strength of the welds, VL-1D (TU582-61) electrode wire 2 mm in diameter is used. At a carbon equivalent of 0.76—0.79 the steel requires no preheating, but at an equivalent of 0.8—0.81, preheating to 100—150°C is recommended. Sheets should be butted as close as possible (the gap should not exceed 0.2 mm on a maximum length of 10% of the total weld length) on Kh18N9T steel

TITLE: Crystal field screening effects for $4f^x$ shells of rare earth ions and nuclear moments

SOURCE: Optika i spektroskopiya, v. 21, no. 3, 1966, 313-318

TOPIC TAGS: electron shell, rare earth, nuclear magnetic moment

ABSTRACT: In calculating the interactions of an electric crystal field with unfilled shells such as the $4f^x$ shells of rare earth ions and multipole nuclear moments, it is necessary to consider the influence of screening due to the distortion of the filled shells. The purpose of the paper was to obtain the most general expressions possible for calculating such screening. Specific calculations applying to crystalline compounds of rare earth elements are performed. For the radial type of excitation, the constants of quadrupole antiscreening are calculated for the case of penetration of the outer charge into closed shells (e. g., in the case of polarization of closed shells by valence electrons). The angular type of excitation is also discussed. It is shown that by solving the perturbed Schrödinger equation in quadratures, one can obtain general expressions for screening constants of potentials of an arbitrary multipole order in the case of radial-type excitation, and in the case of angular-type

AUTHOR:

Makhanek, A.G.

TITLE:

Antiscreening of nuclear quadrupole moments

PUBLICATION: Optika i spektroskopiya, v.14, no.4, 1963, 449-456

CONTENT: An analytical solution of Schrodinger's equation is obtained and, on the basis of the general formulas, values of Sternheimer's antiscreening factor $\lambda_{\text{eff}}(n \rightarrow l)$ are calculated for a series of ions. The possibility of using experimental values of the dipole polarizability of ions and semi-empirical values of the parameter $\langle r^{-5} \rangle$ for calculating values of $\lambda_{\text{eff}}(n \rightarrow l)$ is shown. $\langle r^{-5} \rangle$ varies from 9.80 for A = 210 to 1.2 for A = 2. The equations giving the value of the antiscreening factor are

$$\begin{aligned}\lambda_{\text{eff}}(2p \rightarrow p) &= -\frac{248}{25(2-s)}, \quad \lambda_{\text{eff}}(3p \rightarrow p) = -\frac{1008}{25(2-s)}, \\ \lambda_{\text{eff}}(4p \rightarrow p) &= -\frac{2468}{25(2-s)}, \quad \lambda_{\text{eff}}(5p \rightarrow p) = -\frac{4888}{25(2-s)}, \\ \lambda_{\text{eff}}(6p \rightarrow p) &= -\frac{2712}{25(2-s)}, \quad \lambda_{\text{eff}}(7p \rightarrow p) = -\frac{7228}{25(2-s)}.\end{aligned}$$

Belorussian)

ABSTRACT: Volcanic activity in Belorussia occurred in pre-
Paleozoic, early Paleozoic, and Devonian times. The
pre-Paleozoic volcanics, which occur in the region of
Glussk, are quartz porphyries similar to those in the
Ukrainskiy (Ukrainian) crystalline complex. The early
Paleozoic volcanics, widely distributed in the south-
western part of Belorussia and in Volyn', are composed
predominantly of basalts, dolerites, spilites, and vol-
canic tuffs. Geophysical investigations show that
these rocks produce magnetic anomalies with intensities
of +300 to +600 gammas. On the basis of geophysical
data, it is proposed that Devonian volcanics are present
